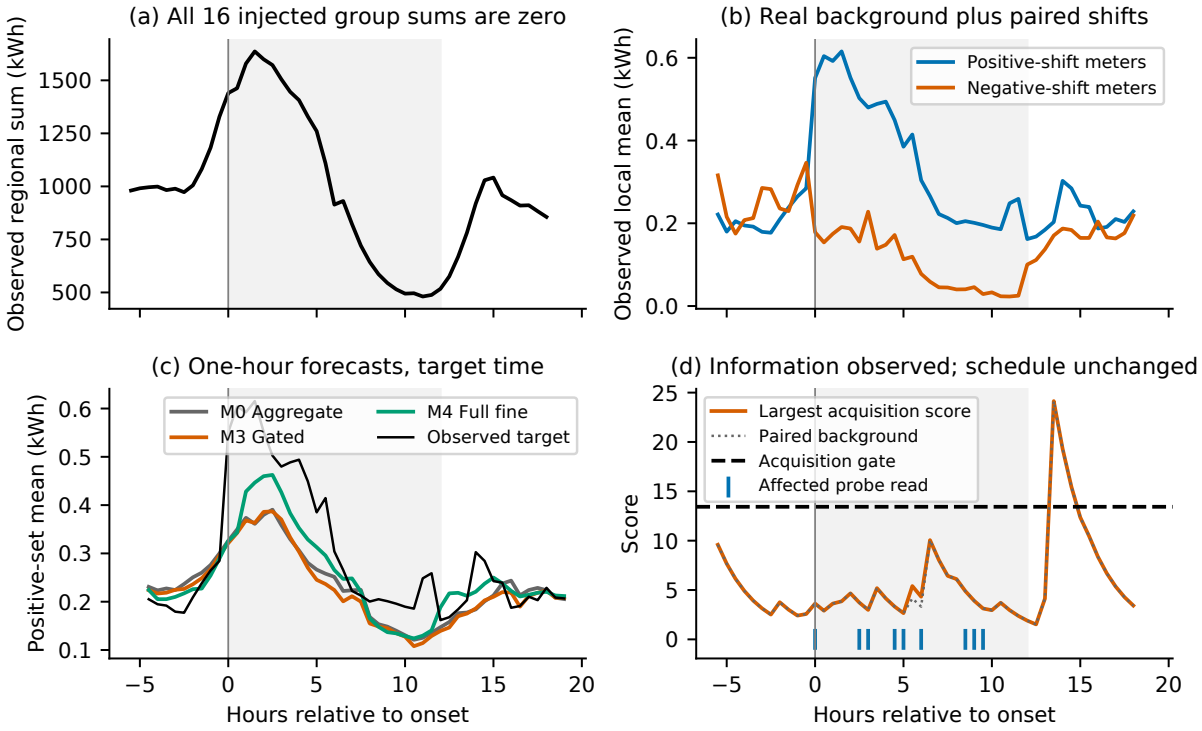

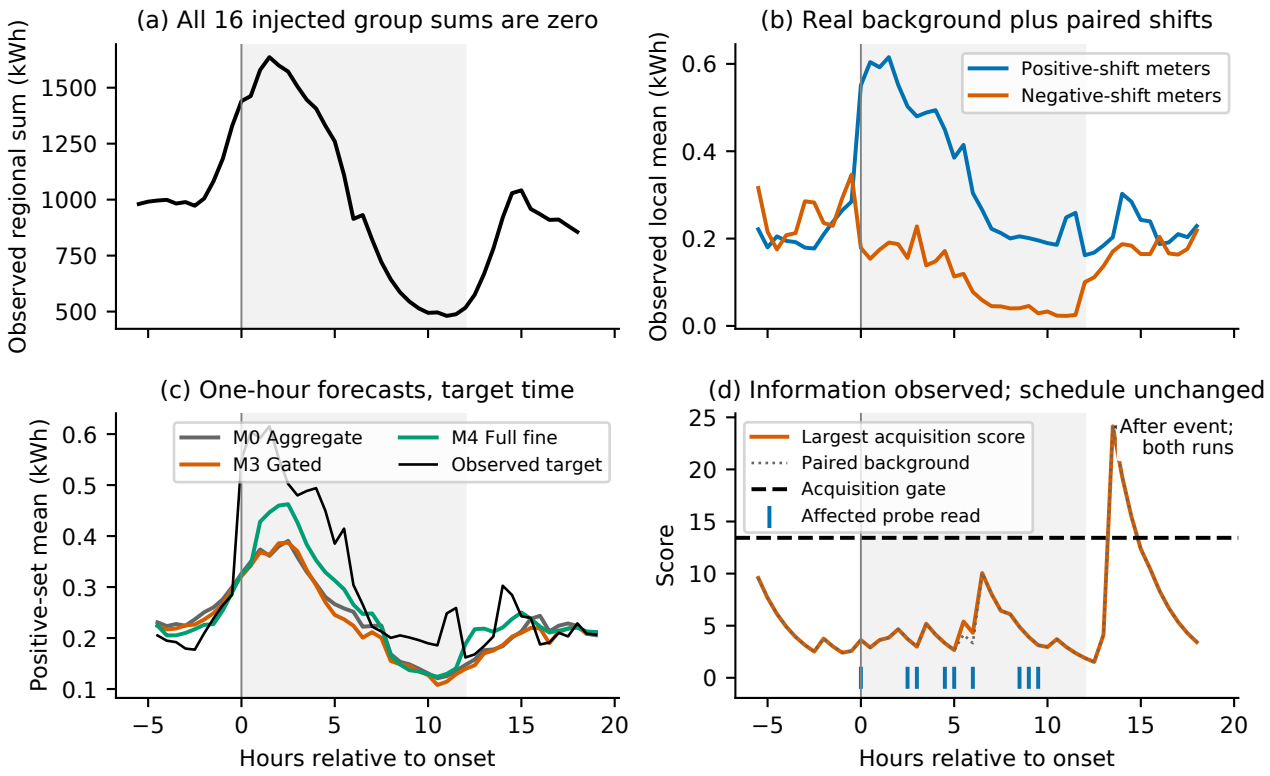

Graphical revision: Figure 2(d)

The original and revised panels use the same curves, gate, probe marks, event window and axis limits. The added annotation identifies the shared score spike 13.5 hours after onset, after the shaded disturbance ends at 12 hours. The spike also occurs in the paired unmodified background. Figures 1, 3 and 4 are unchanged.

Before: preserved comparison baseline

After: Figure 2(d) annotated

This annotation adds no experimental result. The plotted values and input hashes are recorded in `analysis/figure_annotation.json`. The separate `figures/alarm_sweep.pdf` is new technical-note material, reproduced by `scripts/analyze_alarm_sweep.py`; its matched-rate table appears in the revised paper.
